2 Human Values and Psychology

Introduction

- People's views and the way they act in the world are products of their upbringing at home, in the classroom, at the church, among their peers at work, and in their communities. This exposure allows them to form a foundational understanding of the world around them and how other people behave.
- Values shape every action one does. Thoughts are the foundation of one's worldview and have far-reaching effects on one's personality and the fabric of one's community. It has been
- stated that determining one's own priorities and the path they want to follow in life is the single most crucial task they face. The most important thing is to live by one's values. They
- act as foundations upon which one's identity is built and the pursuit of which provides one's life with its purpose.
- As per Rokeach, these convictions are structured into attitudes after having been orientated toward certain classes of circumstances. Rokeach argues that such views might take on a variety of informative, evaluative, and instructional forms. They have a long shelf life and shape one's habits of response to certain circumstances, which is to say that they help shape one's personalities and strengthen one's moral fibre.
- Selecting ideals to prioritise is a common component of moral decision-making. When a person's beliefs and values are incompatible, disagreements and quarrels are likely to ensue.
- When people talk about 'values,' they are referring to the emphasis or weight they place on certain facets of their environment. Both a liking and an idea of what is preferred, values are the essence of what it is to have anything of worth. Values are assigned to every human activity, indicating the breadth of the human experience.
- The attributes and actions described by other virtues, such as aspiration, accountability, and bravery, act as a method to an objective. For all those who hold them, dear, some principles constitute an absolute duty. Due to their status as obligations instead of considerations in policymaking, religious principles are rarely disregarded. Values like compassion, honesty, and liberty are invaluable in themselves.
- As people try to accumulate information and form opinions about the world around them, their beliefs not only develop from their cognitive engagement with the world but also impact their views. Humans have both pleasant and bad sensations related to their beliefs as to what they observe, and these emotions are triggered by their values.
- Values have a significant impact on people's lives. Affective, behavioural, and cognitive (ABC) are three aspects of them that have an impact on their daily lives.
- People have innate tendencies toward specific behaviours due to the interplay of their rational and emotional reactions to their immediate physical and social contexts. What they think, as well as, how they perceive those ideas have an effect on their personality and, in turn, their behaviour.
- A value is a benchmark or measure to guide activities and hence serves as a strong urge to act decisively.
- The moral values held by an individual are enduring or lasting beliefs. There are a small number of general moral values. These include honesty, fairness, respect, compassion, and responsibility.
    - Honesty includes truthfulness, integrity, and trustworthiness
    - Fairness includes justice, equity, and equality
    - Respect includes tolerance, self-respect, and respect for others
    - Compassion includes kindness, caring, and empathy
    - Responsibility includes accountability, obligation, and duty.

Human Values

Trust

- As stated by the Oxford English Dictionary, 'trust' is 'having faith in, relying on, or putting one's confidence in another individual, object, or the validity of a statement. Truth is made up of two subcomponents.
  - To be trustworthy, one must take the necessary steps to earn other people's trust through their actions.
  - The ability to put one's faith in others is an example of the character trait known as 'trustworthiness.'
- One of the most significant ways to establish credibility is to model trustworthy behaviour by, first and foremost, showing people that they can place their faith in you. Customers, suppliers, the press, and the general public might have more faith and rely on an individual, a team, an organisation, a commodity, or a service if they know they can trust that person or that group to do what they say they will.
- Trust involves thinking, emotion, and behaviour, and trust applies to relationships and expectations about individuals and formal institutions.

Honesty

- Being genuine is crucial to earning people's trust and vice versa. In addition to being trustworthy, honesty also involves stating the truth.
- Following are specific actions that truthfulness and trustworthiness imply.
  - Honesty in acts including not stealing, not engaging in bribes, and kickbacks. More positively, it implies respect for the property of others.
  - Honesty in speech means not deceiving, that is, not intentionally misleading others, whether by pretending, manipulating someone's attention, lying, or withholding information that someone has the right to know. More positively, honesty in speech means willingly revealing all pertinent information.
  - Honesty in beliefs (intellectual honesty) means forming one's beliefs without self-deception or other forms of evading unpleasant truths and accentuating evidence favourable to one's self-esteem and biases.
  - Discretion is sensitivity to the legitimate concerns of privacy, especially with regard to confidential information.

Forms of Dishonesty

Lying

- Experts in the field have long fought the concept of lying. When one considers dishonesty, most people think of lying. An explanation for the issue is not every untruth is a lie. If a scientist accidentally delivers wrong test findings on some samples, he is not lying, even if he may not be conveying the truth.
- Despite the complications, most people believe that lies have three elements: a lie ordinarily involves something believed to be false or seriously misleading, a lie is ordinarily stated in words, and a lie is made to deceive.

Deliberate Deception

One may mislead the worth of items or designs by exaggerating their benefits, just as one might misrepresent one's knowledge. An employee is participating in purposeful deceit, even if he is not really lying if he talks about technical issues in a way that indicates expertise that he does not have in order to impress an employer.

Withholding Information

Dishonesty can also take the form of concealing or missing relevant information. An employed person gets involved in serious deceit, even if they are not intentionally lying, if they fail to explain some of the deleterious elements of the project they are trying to promote to one's superior.

Courage

- The ability to conquer fear is often more appreciated than fear or timidness, and although, the kind of worries and the means

to conquer them change from culture-to-culture, the value of this trait remains constant.

- Courage may be broken down into three categories which are moral, physical, and psychological.
- The courage involved in addressing one's personal demons encompasses the type of psychological strength needed to fight a disease or damaging habit or scenario.
- A person with moral bravery would not compromise their morals even if it cost them their social circle, job, or reputation.
- Having overcome the dread of bodily pain or death to rescue others or oneself is an example of physical bravery.

Moral Courage

- It is both a quality of mind and a quality of spirit because, like all ethical activities, it requires the use of both the logical and the intuitive faculties, both the procedures of intellectual debate and the sentiments of right and wrong that are inherent to each human.
- One definition of moral fortitude is the mental and emotional fortitude that allows one to stare down ethical issues head-on without shrinking back or giving in.
- When faced with subtle to violent persuasions that make people want to run away, it is essential to act without hesitating or shrinking.
- Action has to be persistent and confident in the strength of its means, i.e., the ethical, cognitive, and emotional aspects of argument and persuasion, to overcome formidable opposition.
- It allows people to face the issues, not with the expectation that they will be solved or even that they will be able to master them, but with the confidence that they will.

Integrity

- Moral integrity is the unity of character, and the unity is consistency among one's attitudes, emotions, and conduct concerning justified moral values.
- Integrity is a bridge between responsibility in private and professional life. Morality requires that one's lives be unified where fundamental values are at stake, not compartmentalised.
- Integrity is derived from the Latin word integritas, which means completeness and wholeness. Integrity describes a feature in which a person is honest about their thoughts, feelings, and actions, both in public and private. Those who 'own' their emotions and actions instead of blaming others for how they make them feel or act are happier and healthier overall.
- Integrity, authenticity, and honesty all have the same meaning, yet they can have somewhat distinct implications. Genuineness in communication and presentation are both components of honesty. The emotional and mental depth is what people mean when they talk about authenticity. Integrity is the quality of being honest and having no dishonest motives.
- Courage is defined as 'a regular pattern of behaviour that is consistent with core beliefs,' including 'implementing what one proclaims,' 'publicly justifying moral beliefs, even when those beliefs are not popular,' and 'treating others with care,' as shown by one's willingness to lend a hand to those in need along with respect for other people's wishes.

Kindness

- Acts of kindness may vary from brief, such as giving up your seat on the bus to a woman with her baby, to substantial things such as donating organs to a loved one.
- Kindness is the inherent tendency to be kind to others, to care about them, to help them, to do them a favour, or to do something good.
- "The simplest acts of kindness are by far more powerful than a thousand heads bowing in prayer," said Mahatma Gandhi.

Perseverance

- One definition of perseverance is the ability to remain focused on a goal despite distractions or setbacks.
- To persevere is to knowingly and willingly persist in one's pursuit of a goal despite

the presence of obstacles, problems, or discouragement.

- Perseverance is not as powerful as courage, but it is similar as both require summoning the desire to act despite internal conflicts. Monotony, aggravation, effort, and the desire to do something simpler and maybe more enjoyable are the real threats here, not fear.

Forgiveness

When individuals forgive, their underlying feelings and attitudes toward the offender change to be more constructive (e.g., kind, generous) and less harmful (e.g., angry and bitter). For example, when someone forgives their spouse who hurt or insulted them, it signifies the number of times that person has changed for the better.

Gratitude

Gratia, which means grace or gratefulness in Latin, is where we get the term gratitude. To be grateful, one must feel that they have benefitted from another person's deeds. Gratitude is a feeling of thanks and delight in reaction to an offer, whether the gift is something material or, for example, an experience of quiet happiness brought on by the presence of stunning natural scenery.

Humility

- Accurate self-assessment of one's strengths and weaknesses; willingness to accept criticism, additional knowledge, and guidance; the ability to look beyond the self; attempting to keep one's strengths and weaknesses in point of view; and admiration of several manners in which humans and objects can coexist are all hallmarks of a truly humble person.
- One of the hallmarks of a humble person is their capacity to step back and take a look at oneself objectively rather than through rose-coloured glasses.

Hope

Words like hope or optimism refer to a mental, emotional, and even motivational position towards the future. Thinking about the future, hoping for a positive result, taking steps you believe will increase the likelihood of that outcome happening, and being sure that you will achieve your goal if you work hard enough.

Compassion

- Despite their similarities, compassion and empathy are distinct ideas. When people's thoughts and feelings about another person also include a wish to assist, they call it compassion, as opposed to empathy, which is a broader concept.
- According to the academic study of emotions, it is 'the experience of being moved to action in response to seeing the distress of another person.'
- However, one might feel compassion without acting on it, and selflessness is not necessarily driven by compassion; altruism is the good, unselfish activity typically triggered by sentiments of compassion.
- What people mean by 'emotion recognition' is being able to put yourself in another person's shoes and understand how they are experiencing.
- Emotional resonance, or empathising with the other person, is one definition. Resonance may be divided into two categories: the phenomenon of identical resonance occurs when one person's suffering is transferred to another. Saying, "Oh! I am so sorry that you are going through this. Please tell me how I might be of service to you." It is called reactive resonance, and it is been shown to exist.
- Having sympathy for any sentient person is an example of 'sentient compassion.'
- Family compassion is the first kind of kindness learned, nurtured, and passed down from generation-to-generation.
- International kindness is when individuals of diverse cultures and backgrounds help one another.
- There are two types of heroic compassion: if you are thinking about saving someone's life on the train, and then you spontaneously leap into the tracks, that is heroic compassion. That is just how he is, impulsive. The act of heroism people call 'considered compassion'

is not performed on the spur of the moment but rather after careful consideration.

Empathy

- To have compassion for someone may mean many different things. Empathy is defined by those who study feelings as the capacity to 'put oneself in another's shoes' to feel and understand what another person is experiencing.
- In the modern academic literature, two distinct forms of empathy have been identified: affective empathy and cognitive empathy.
    - Affective empathy: this refers to the feelings one acquires in reaction to other people's emotions. This might entail reflecting on what such a person is experiencing or merely feeling worried when he/she senses another's dread or worry.
    - Cognitive empathy: this is also known as perspective-taking, which is the capacity to recognise and comprehend the feelings of others.

Attitude

Two people may look at the same thing and get very different conclusions about what it means to them. That is because, they have different perspectives on things. The term 'attitude' refers to one's belief and persistent inclination to react positively or adversely toward something. This 'something' might be anything from an event to a person to an item to a category of events, people, or things.

Attributes of Attitude

- It is a long-term assessment of a wide range of socially relevant topics and events. Attitudes are intangible concepts that cannot be seen in the physical world. People can only deduce them based on their actions.
- Attitude may be communicated both verbally and non-verbally. Attitude is learned throughout one's formative years in school. People on their own or in teams might be involved.
- Attitude is crucial because it affects how individuals interpret their surroundings and how they act in public. It affects social interactions in several ways, including levels of friendliness or hostility, willingness to assist others, consideration given to applicants from underrepresented groups, etc. Moreover, many violent actions, including crime against humanity, are motivated by views.
- Having a firm belief in one's own rightness does not make one any more powerful. Some people have fixed opinions based on their own knowledge and experience, without taking into account the perspectives of others around them. As a human is a 'rational' animal, his outlook evolves as he gains more experience.
- One cannot assume that one's attitude toward comparable things or occurrences will remain constant. A person might be conflicted regarding an item if they have both good and negative emotions toward it.

Attitude Framework

- The ABC (Affective, Behavioural, Cognitive) model and the Mode model, both of which may be thought of as frameworks for conceptualising the organisational principles underlying attitudes, have been particularly influential in this regard.
- The affective dimension describes how one feels about the object of that attitude, whether those emotions are favourable or unfavourable. There are a variety of ways in which emotional reactions might affect one's perspective.
- The post-behavioural or experience-based components of an attitude object are referred to here as the 'behavioural component.' The disposition to act in a particular way concerning the subject of the mindset.
- The object's cognitive component consists of our preconceived notions of what that item is and how it works. A person's disposition may be influenced by the positive and negative connotations they attach to a thing.

Persuasion

The term 'persuasion' refers to both the act of convincing someone and the state of being convinced. Persuasion is a broad concept that

encompasses all forms of influence, including the ability to sway someone's thoughts, feelings, intentions, goals, or actions.

Aptitude

- A person's aptitude for anything might be defined as their innate skill or propensity for doing that thing. The term 'natural' in this context does not mean 'by birth' in the strict sense but rather refers to a person's life as a whole. If a person has a natural talent for boxing and gets the proper instruction, they may become very good at the sport. However, if someone lacks a natural talent for boxing, no amount of practice will improve his skills much. Therefore, aptitude is the sum of one's innate and learned skills and traits that are predictive of one's potential for mastery in a certain domain.
- How people react to a given situation in future is influenced by their past experiences and preferences formed by those experiences. Several factors may affect someone's actions. An individual's aptitude may be measured by how well they do a given activity.
- A set of traits that are indicative of a person's potential for skill development in a certain field is called aptitude. Competence, on the other hand, is a product of practice and study. In contrast to popular belief, aptitude does not equal competence. Typically, one's aptitude might be either physically, or mentally based.
- A person's level of physical aptitude may be defined as the set of innate abilities and skills that allow them to effectively complete a given activity. For instance, members of the armed services need to meet certain physical requirements, such as certain height and weight. To be mentally adept, one must possess a unique set of skills that are essential for completing a variety of jobs. To elaborate, this is thought of having a high level of intelligence and a strong sense of ethics.

Values in Engineering Profession

- When faced with an ethical choice, engineers might look to the core ideals of their profession for guidance. Thinking morally entails relying upon ethical resources, considerations, and guiding principles to arrive at reasoned judgments for concrete decision-making situations.
- As a profession, engineering is the safe advancement of the progress of the human community, in partnership with nature, through systematic practice of clear, clean, and practical decision-making.
- Engineering as a profession is dedicated to five key values as given below.
  - Safety
  - Human progress
  - Clean, clear decision-making
  - Community
  - Partnership with nature
- Safety is emphasised as a top priority in the codes of conduct of professional engineering associations. An engineer's first responsibility must always be to ensure citizens health and safety.

Safety and Risk

- Engineers must provide secure goods, buildings, and procedures for the public, as seen by the ethical codes in their profession. While it is impossible to ensure complete safety in any design, engineers have a responsibility to minimise risks as much as feasible. Every product comes with the implicit guarantee that it will function as described, and every product also comes with the implied guarantee that it is safe for consumers to use.
- The chance of loss is what people mean when they talk about the risk. Danger and risk are often used interchangeably in the same context.
- The absence of danger, harm, or threat is what people mean when they say that someone or something is safe. When people do anything hazardous, or something with a high potential for serious harm, they are engaging in risky conduct.
- To what extent is risk acceptable? How secure is secure enough? Risk must always be considered while talking about safety. Any

structural design will necessarily have some degree of risk, and it is difficult to eradicate all risks.

- Taking a chance voluntarily is considered safer than being compelled to do something a person knows is dangerous, yet many people only feel this way in theory. Some individuals will be enticed to purchase a home close to a factory that releases low quantities of pollutants into the atmosphere if the prices are low. They are taking the risk in exchange for low rent. However, the danger will seem greater if someone who already lives near a facility discovers that the factory generates poisonous gases and he was not informed.
- If the negative consequences can be undone in the end, people are more likely to take the risk. This idea is similar to the short-term versus long-term risk that have been covered before.
- It is essential to keep in mind that the predicted probability is only the best estimate in this case. Many people would consider a one in a million probability of catastrophic harm to be a tolerable risk. In contrast, others might not be willing to take even a 50-50 chance of suffering just a minor injury. Many people would refuse to swim at a beach with a high concentration of jellyfish because of the increased risk of being stung, which may be unpleasant but is very unusual and deadly.
- If the impacts can be measured, people will have higher risk tolerance. Somewhat dangerous only at reasonably high concentrations will seem safer than anything with regular exposure to risk due to the following phenomenon. One's risk of getting involved in a car crash, for instance, remains constant regardless of how frequently one travels by car. On the other hand, research shows that modest doses of nuclear radiation are actually helpful to human health and that significant health issues or death only occur at greater doses.
- Risk perception changes when the negative consequences of an action are postponed over a longer period of time, as opposed to occurring right away. Long-term effects of a high-fat diet include an increased risk of cardiovascular disease and stroke. However, many people do not care about the potential danger and choose to disregard the warnings.

Accidents

- To further one's understanding of safety and the engineer's responsibility to society, it will be helpful to examine some thoughts on the nature of accidents now that we have covered some groundwork on these topics. The purpose of this kind of research is to figure out how accidents happen. Thus, one needs to figure out how to avoid them. Research of this kind has implications for engineers as public safety is one of their primary responsibilities.
- Examples like an inadequate review of drawings before approval, disregard for established design standards, and other similar blunders fall into this category. It is generally accepted that procedural accidents may be mitigated by bolstering existing measures of training and supervision, enacting new rules and regulations, or putting existing ones under closer inspection.
- Many different approaches exist for studying and understanding accidents. One approach classifies mishaps into the three categories of procedure, engineering, and system. The majority of mishaps may be traced back to a person's failure to follow standard operating procedures or the selection of an ineffective alternative. For instance, pilot error is often blamed for accidents that are really the result of standard operating procedures in the aviation sector. Besides the pilot, other airline employees such as air traffic controllers are also capable of making this kind of mistake.
- To prevent and fix engineered faults in the final product, designers must keep them in mind throughout the design phase. As more data is gathered from experiments and practical experience, one will learn how to prevent and mitigate incidents of this kind. Faults in the plan are the root of all engineered mishaps. Material failures, malfunctioning equipment, and devices that do not work reliably in all

situations fall into this category. For instance, turbine blades in aeroplane engines are prone to developing tiny fractures called microcracks. As the cracks widen, the blade might eventually fail and shatter. Metal pieces have sometimes broken and injured passengers when this has happened.

- Systemic accidents are more difficult to analyse and manage. They are typical of advanced technology and the sophisticated infrastructures needed to maintain them. The engineer has to know the intricacies of the systems he is building and use his imagination to figure out how to make the technology fool proof. As there are several unrelated causes that might lead to a systemic mishap, it may be easy to assume that the engineer is not at fault for such an occurrence.

Extent of a Risk

- Three factors determine the extent of a risk as given below.
  - How severe is the possible harm to each individual?
  - How widespread is the danger?
  - How likely is the danger?
- The more severe the risk is, the more important it is for the company to disclose the risk in its entirety, as soon as possible. The three interconnected aspects discussed earlier may each play a role in determining the level of danger.

Characteristics of Danger

- There is a significant gap between the situation in which people knowingly put themselves in a harmful way to acquire what they want and the one in which others put them in harmful way without one's knowledge or agreement to obtain something they want.
- The character of the risk should also be considered alongside its magnitude when assessing whether the potential reward is worth the potential downside. Therefore, engineers have a unique incentive to avoid risks on people who are unprepared for them, those who cannot prevent them, or those who stand to gain nothing from them. This variation in hazards shows that there are three primary considerations to weigh when evaluating acceptable risk.
  - Are those who may be harmed aware of the possible dangers?
  - Is the threat freely taken?
  - Do people who put themselves in danger ultimately profit from taking such risks?

Disclosure of Risks

- The engineer or executive should ask herself these five important questions in order to determine when and if to publish a risk that is created by an activity that is being considered.
  - Are we required by law to warn others about the potential danger?
  - How large of a blow will it be to the firm if the danger is made public?
  - Is there anything the community can do to lower the danger level?
  - Should the material be withheld, do you have any valid grounds for doing so?
  - How severe is the potential impact?
- There are many valid reasons why a danger should not be made public, including protecting national security, legal businesses, confidential business information, and avoiding public panic. These considerations have to be weighed against the first three variables. Given that it is preferable to incur hazards freely than to be forced to do so, it may seem as if businesses and other organisations should constantly disclose any risks that their activities bring to the general public. Having said that, this requirement is too rigorous.
- In conclusion, an engineer has to put a high priority on both avoiding risks and bringing attention to those risks that are worthwhile taking. Beyond the confinement of the job, engineers put high importance on ensuring the well-being of others.

Occupational Safety and Health

- Occupational health is a multi-disciplinary issue concentrated on the protection of safety, health, and welfare of people engaged in work or employment.

- The International Labour Organisation and World Health Organization (WHO) have agreed on a common definition for occupational health. 'Occupational health should aim at the promotion and maintenance of the highest degree of physical, mental, and social well-being of workers in all occupations; the prevention amongst workers of departures from health caused by their working conditions; the protection of workers in their employment from risks resulting from factors adverse to health; the placing and maintenance of the worker in an occupational environment adapted to the psychological and physiological capabilities; and to summarise the adaptation of work to man and of each man to his job.'
- The term health when referring to work indicates the absence of disease and infirmity. It indicates the physical and mental elements affecting health directly related to workplace safety, and hygiene.
- Occupational health deals with all aspects of health and safety in the workplace and strongly focuses on the primary prevention of hazards. The health of the workers has several determinants, including risk factors at the workplace leading to cancers, accidents, musculoskeletal diseases, respiratory diseases, hearing loss, circulatory diseases, stress-related disorders, communicable diseases, and others.
- The existing Occupational Health Safety (OHS) legislation in India's objectives are given below.
    - Creating a legal structure that will allow for the passage of universal enabling legislation on occupational health and safety regarding all areas of economic activity
    - Establishing a programme of rewards and benefits for both employers and workers in order to motivate them to meet better health and safety requirements and offering clerical and technical assistance, as well as, support services
    - Establishing and developing capabilities for research and development in emerging risk areas and proper control measures
    - Lessening the number of illnesses, injuries, and deaths brought on by one's place of employment and decreasing the financial burden of occupational illnesses and injuries
    - Raising the level of knowledge among the population about different aspects of occupational health and safety

Human Progress

- Commitment to the improvement of human well-being is another hallmark of the ethical engineer. He has the goal of elevating people's standard of living. This indicates that his goal is to utilise technology in a way that is beneficial to others rather than harmful to them. In general, a complete engineer has a civic-minded attitude, demonstrates compassion for others, and is helpful to those around them.
- Knowledge and the betterment of living conditions are the two primary pillars upon which human development is built. The ethical engineer is committed to the expansion of knowledge in all aspects, both theoretical and practical. This indicates that the full engineer is interested in developing novel solutions that contribute to the expansion of human knowledge. He stays current in his industry and is constantly keen to learn new strategies, procedures, and methods.

Clear and Clean Decision-Making

- There are a variety of approaches that may be used by individuals when making choices. As a career, engineering is devoted to the practise of creating judgments via the use of clear, clean, and rigorous reasoning. The engineer examines the issue, collects and documents accurate and trustworthy information, employs caution, focus, and inventiveness in the process of resolving the issue, and finally tests his solution in an effort to reach greatness.
- Ethical engineer is open to new concepts and creative approaches, but at the same time, they are constantly working to ensure that their inventions are reliable and risk-free. When it comes to one's work, this entails painstaking accuracy and attention, precise and detailed documents, and a desire

to achieve perfection in all aspects of one's job responsibilities.

Community

- A community comprises a collection of people working toward the realisation of a shared moral vision via the establishment of shared institutions, practises, relationships, and experiences, all of which are committed to the realisation of that goal.
- Although, collaboration among engineers is obviously very important, the word 'community' refers to a broader concept than just exchanging ideas and information with co-workers and colleagues at work.

Partnership with Nature

The essence of being human is one's urge and ability to build and make things that change the environment in which one lives. Thus, engineering is a distinctively human science. And the way engineers regard their task has profound moral significance. Engineering is the way people relate to the world in which they find themselves, and how they do this defines their role in the cosmos.

Environmental Awareness

Environmental awareness has two aspects as given below.

- The first concerns direct harm to the quality of human life. This may be called 'environmentalism as prudence'.
- The second aspect of environmentalism concerns the preservation of nature for its own sake. This may be called 'environmentalism as an ethic.' This second aspect requires an understanding of our place in the natural world.

Commitment and Cooperation

- Commitment means acceptance of the responsibilities and duties, and cooperation means help and assistance. By developing team commitment and cooperation in a work team. You are assisting the team to meet its goals and objectives. Work teams that are committed and cooperative are more likely to achieve the goals the business has set.
- Several signals indicate the work team is committed and cooperating. These include the following points.
  - Maintaining or increasing quality
  - Reaching or exceeding production targets
  - Decreasing complaints from team members
  - Limited conflict between team members
  - Fewer workplace injuries

Key Terms

- The line that separates health and safety is murky, and the two terms are often used interchangeably to convey care for the individual's physical and emotional welfare at their place of employment. Safety refers to the protection of individuals from physical harm.
- Health refers to the protection of people's bodies and minds from a sickness that may be brought on by the products, techniques, or procedures that are utilised in the workplace.
- Occupation-related ill-health refers to any sickness or condition, whether physical or mental, that is either directly caused by the activities performed at work or is a contributing factor in the development of such disorders. The amount of time that passes between exposure and the beginning of the sickness might be quite little (as in the case of asthma episodes), or it can be quite lengthy.
- Welfare refers to the act of providing persons with the resources necessary to preserve their health and well-being at their place of employment. The term 'welfare facilities' refers to a variety of amenities: washing, sanitary arrangements, the supply of clean drinking water, garment storage, sitting, bathrooms, etc. In addition, the provision of first aid falls within the category of welfare activities.
- An accident is defined as any unforeseen incident that has resulted in harm or ill health of persons, damage or loss to property, plant, materials, or the environment, or a loss of commercial opportunity when viewed from a policy standpoint.

- Environmental protection: these are the preparations made to cover those actions in the workplace that influence the environment (in the form of flora, wildlife, water, air, and soil) and perhaps the health and safety of workers and other individuals. These kinds of operations include the discharge of waste and wastewater and polluting the atmosphere.
- Dangerous incidence: this is a close call that might have resulted in significant damage or perhaps death. The outcome could have been either. The toppling of a scaffold or crane, as well as the malfunctioning of any passenger-carrying apparatus, are all examples of dangerous incidents.
- An occurrence that comes dangerously close to causing an accident is referred to as a 'near miss.' Research has revealed that there is a roughly one in ten chance of a lesser accident happening at a specific site in the workplace for every near miss incident in that area.
- A hazard is the ability of a drug, person, action, or process to bring injury, and risk is the probability that this potential will actually occur. Chemicals, electricity, or even working from a ladder on a tall ladder may all be examples of many kinds of hazards.
- The possibility that a drug, activity, or procedure may cause damage is referred to as the risk. Through proper management, a risk may be mitigated.
